

Date	13 November 2022
Team ID	PNT2022TMID51072
Project Name	Virtual Eye - Life Guard for Swimming Pools to Detect Active Drowning
Maximum Marks	8 Marks

OUTPUT COMMANDS:

- Direct the output from a job to your terminal. The output includes the job's job control language statements (JCL), system messages (MSGCLASS), and system output (SYSOUT) data sets.
- Direct the output from a job to a specific data set.
- Delete the output for jobs.
- Change the output class(es) for a job.
- Route the output for a job to a remote workstation.
- Release the output for a job for printing by the subsystem.

OUTPUT is a foreground-initiated-background (FIB) command. This command is generally used in conjunction with SUBMIT, STATUS, and CANCEL commands.

The OUTPUT command applies to all jobs whose job names begin with your user identification. Access to jobs whose job names do not begin with a valid user identification must be provided by an installation-written exit routine.

Batch jobs are subject to the SUBMIT, STATUS, and CANCEL commands. To use these commands, you need to have specific authorization.
